

THE WORLD OVER

DOUGLAS TO ADVISE ALBERTA

LONDON—Major C.H. Douglas, father of Social Credit, has agreed to send two of his colleagues to Alberta to canvas and report upon technical and political situation in the province as a preliminary step to his possible personal visit to help introduce a "genuine social credit scheme."

The agreement was reached after a three-day conference with G. I. McLachlan, emissary of the Alberta government, in the quiet of Major Douglas' fishing lodge in Scotland.

G. F. Powell, for 19 years associated with Major Douglas and at present director of the social credit movement, was selected as chief commissioner.

He is regarded as one of the outstanding authorities on social credit and has written several treatises and articles on the subject.

PIET KNIGHT TRAMPLED TO DEATH ON SUNDAY

HAYWARD, Calif.—Pete Knight, 33, Crossfield, Alberta, world champion bronze rider and former all-round cowboy champion, was thrown and trampled to death by his horse before 5,000 persons at a rodeo here Sunday.

He was tossed over the animal's head as it reared and plunged. One of his hoofs came down on his body. Knight died shortly afterward.

He was one of 100 nationally-known cowboys participating in the finals of the 18th annual Hayward rodeo.

Knight had ridden the horse, Slow Death, eight or nine times.

JOHN D. ROCKEFELLER SR. DIES

ORMOND BEACH, Fla.—John D. Rockefeller, Sr., founder of one of the world's most colossal private fortunes and benefactor of humanity, died in his 93rd year Sunday at his winter home, "The Casements."

Death came of the aged capitalist, who long ago had withdrawn from the tumult of the financial world, at 5:05 a.m. P.D.T. His physician, Dr. Harry L. Mervault, attributed the death to senile myocarditis, a hardening of the heart muscles.

The grasshopper bait mixing station has been operating this past week and many young boys are reported to be hatching out. Cool weather has slowed up the demand for bait.

RED BUS LINES LIMITED OCCUPY NEW QUARTERS

Immediately east of the new Red Bus Lines garage, the bus company has constructed its own headquarters office and waiting room, a 2650 sq. ft. brick building, which is a credit to the management.

Commodious, airy and well-lighted, the new building is attractively laid out for up-to-date accommodation of both company and patron. Modern comfort stations for ladies and gentlemen, respectively, have been installed.

Red Bus Lines Limited will occupy the new terminal on Friday of this week, and will continue uninterrupted service to their many patrons in the fine new building. Two new buses

VOLUME 16, NUMBER 17

OVER TWO INCHES OF MOISTURE HAS FALLEN DURING PAST WEEK

Moisture Will Greatly Benefit The Growing Crops

Last week end brought a bountiful rain to all parts of the district and in the three days over two inches of rain fell in the Carbon vicinity. On Wednesday night and Thursday morning almost three-quarters of an inch of rain fell. The weather cleared off for a couple of days, but on Saturday the skies again clouded over and rain commenced to fall, lasting practically all day Sunday, before the skies again cleared off. Over an inch and one-half of moisture fell during the last storm and as a result the crops are beginning to grow rapidly and much of the grain that was cut off by the high winds is beginning to come again.

While a few fields were badly blown with wind, this condition is not general and crop prospects at the present time are considered very good.

Cloudy skies as we go to press on Wednesday indicate more rain before the weather clears off.

\$700,000 FOR MAIN ALBERTA ROAD PROGRAM

The federal grant, mainly for highway construction purposes in Alberta, will amount to \$700,000. It was reported recently. Matched dollar for dollar by the province, this means a \$700,000 program to be financed this year by the two governments.

Under the agreement, at least 50 per cent of those engaged on the work must be relief recipients.

A draft of Alberta's projects has been sent to Ottawa by the provincial public works for consideration so that there can be a selection of those to be included on the current season's program.

In the meantime the provincial government has announced that it is starting work immediately on various projects of its program.

The intention is to hard surface the main highway stretch between Edmonton and Millet, on which considerable reconstruction was done last year.

In the north there will be graveling of the Peace River highway for a 22-mile stretch around Lesser Slave lake.

Hard surfacing of various links of the main highway system also is to be the program for southern Alberta.

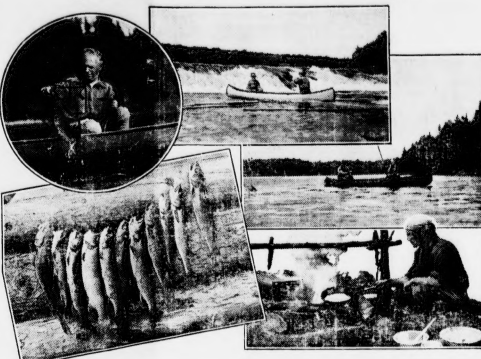

There have been placed in service this week to replace part of the equipment destroyed by fire on March 27. The company operates bus services daily on one-hundred miles of Alberta highways, connecting with fast through service to all points in Canada, the United States and Mexico—Drumheller, Mil.

Sport Fishermen Ready for Season

Canadian fishermen, bored to tears after telling each other all winter about the big one that got away, will soon be able to make a fresh start. Spring brings the opening of fishing season throughout Canada, and indications from inquiries from sportsmen and information from guides pouring into the offices of A. O. Semour, general tourist agent, Canadian Pacific Railway, Montreal, are that game fish are going to have a hard time of it.

More people are planning early fishing vacations to take advantage of the fishing while it is at its best. Reports from Canadian Pacific Railway hotels in the Maritimes and Quebec, the Devil's Cup and French River Bungalow Camps, and in Ontario and Bananaw camp and hotels in the Canadian Rockies, as well as favored fishing centres on Canadian Pacific lines

indicate that sportsmen are on the move again. The number of Canadians travelling within Canada and of Americans visiting this country especially for fishing will run into many thousands. In a country the size of Canada, and with its variety of fish and conditions, opening seasons vary widely.

In the different provinces, a fact shown in fishing booklets obtainable from all Canadian Pacific Railway agents.

SCOUTS' CONCERT AND DANCE

The attention of our readers is drawn to the advertisement in this issue announcing the concert and dance to be held in Carbon on Friday, May 28th. Calgary Merry Makers' orchestra will provide the music for the dance.

LOCAL NEWS ITEMS

Mr. Hugh Isaac left on Friday to attend the A.Y.P.A. convention at Lethbridge.

Miss Alvina Gieck of Drumheller spent Sunday visiting in the district.

Misses Florence Gibson and Beatrice Bacon have secured work in Calgary and left on Saturday for the city.

Mr. and Mrs. W. Poxon, Lawrence and Wilfred, and Miss Marion King, of Drumheller, attended the Masonic gathering in Carbon on Tuesday.

Mr. N. Ramsay and Mabel, and Mrs. Bruce Ramsay were Calgary visitors the first of the week.

LIBERALS PLAN BIG CONVENTION IN CALGARY

EDMONTON, May 19—Alberta Liberals are expected to muster 2,000 strong in Calgary June 4 and 5 when the party convention will be held to select a new leader and draft policies for the next election. Preparations are being made to handle one of the largest political rallies ever held in the west, plans already being in shape to provide adequate auditorium, bulleting and camping arrangements.

Delegates are expected to number more than 1200 with many alternates and visitors. During the general convention a women's liberal association will be formed and steps are being taken by young liberals to organize a branch of the Alberta association.

Cattle Require Spring Medicine

The lack of mineral, and especially the lack of phosphate in Canadian farm crops, has become more and more apparent in recent years. Some districts are no longer capable of growing crops with sufficient phosphates to meet livestock needs in any season, and in seasons of drought, when the mineral content of all crops is lowered, phosphate deficiency becomes serious, says R.M. Rowat, B.Sc., and an authority on soil, and show itself in areas not usually subject thereto. Ontario and the Western Provinces have extensive areas with depleted phosphate, and no province has escaped the effects of phosphate deficiency.

Lack of calcium and phosphorus may show up in many ways. Most common in young animals is the development of rickets, and in mature stock it is found that bone brittleness, decreased appetite, stiff-sickness, general debility and thriftlessness, failure to breed, are all partly traceable to lack of these essential minerals.

Diseases due to phosphate, which go under the various names of osteomalacia, phosphorosis or plain "stiff-sickness," are essentially winter conditions, which develop slowly, reach their peak in the late spring, and then disappear for the summer, while the animals are on pasture.

Diets of mineral deficiency, because they have the relatively high mineral need. A good cow, giving about 10,000 lb. of milk per year, needs nearly 30 pounds of calcium and phosphorus for milk production only. For her own maintenance and for the growth of her calf during the period of gestation, she requires another 20 pounds—total 50 pounds per year.

This is her actual bodily need. Under winter feeding conditions she has to consume as much as two pounds of mineral to assimilate one pound, and it can therefore be readily understood that a lowered mineral content in the feed that times are a very serious matter. A ton of good Timothy hay at best contains only 5 or 6 pounds of combined calcium and phosphorus. In drought years this may fall to 3 or 4 pounds and "stiff-sickness" is almost inevitable in such circumstances.

For dairy cattle in particular, a liberal allowance of calcium and phosphorus is required. Milk cows need both substances to make milk and produce strong healthy calves. An adequate supply of phosphate stimulates milk production and helps to ensure vigour in young calves.

WEEKLY COMMENT ON THE WORLD OF WHEAT

BY H. G. L. STRANGE

Bushels threshed can never be more than the rainfall will warrant.

That is a fundamental, natural law operating in Western Canada, and in any other semi-arid wheat area in the World.

Yields per acre, of course, are partly dependent upon many conditions which vary with each district; quality of soil, amount of evaporation, occurrence of frost and hail, the amount of insect infestation, and of disease infection.

But the rainfall which occurs during the growing season, and during the previous fall months, has been found to be by far the most important factor governing bushels harvested.

How much rainfall is required to produce an average wheat crop. Investigations that have been made by the late Sidney Barnes at the Dominion Experimental Farm, Swift Current, and by the Research Department of the Scarle Grain Company seem to indicate that about 12 inches of rainfall is required to make an average crop. Of this some 8 inches is necessary during the growing season, from April 1st to July 31st, and four inches during the previous fall month.

LIST OF GAMES TO BE PLAYED IN BASEBALL LEAGUE IN MAY, JUNE

Each Team in League to Have Two Home Games

The following is an outline of the games to be played in the baseball league for the months of May and June:

May 26—Trochu at Carbon. Three Hills at Huxley.

May 28—Trochu at Torrington. Huxley at Three Hills.

June 2—Torrington at Three Hills. Carbon at Trochu.

June 4—Torrington at Carbon. Trochu at Huxley.

June 9—Three Hills at Torrington. Carbon at Trochu.

June 11—Huxley at Carbon. Trochu at Three Hills.

June 16—Torrington at Huxley. Carbon at Three Hills.

June 18—Huxley at Torrington. Three Hills at Trochu.

June 23—Carbon at Torrington. Huxley at Trochu.

SOFTBALL MEETING

A meeting of Carbon softball players was held in Babe's Barber Shop last Wednesday and the following officers were elected:

President and Coach, W. Reid.

Secretary-Treasurer, Frank Emery. It is the intention of the Carbon players to enter a team in the league with Hesketh and Grand Forks.

CLEAN-UP DAY AT CEMETERY

Wednesday, June 2nd is the day set for the annual clean-up at the Carbon cemetery and as usual it is the intention to trim the hedges, clean out the dead tree trunks, etc., and in general to endeavor to put the grounds in a presentable condition.

The F.W.A., and the I.O.B.F. are sponsoring the undertaking and anyone interested is asked to be present and lend a helping hand.

Of August, September and October. More rainfall than this brings about a higher yield, less rainfall brings smaller crops; less than 10 inches produces a small crop, less than 8 inches a complete failure.

The following factors have tended to raise prices:

Unfavorable new crop prospects in importing countries. Complaints of rust in France. Corn planting delayed in the Balkans. Deficient rainfall in Australia and complaints of grasshoppers. Forecast of slight reduction in Canadian grain areas south. Spanish tickled olive crop abnormally small. Irish Free State abolishes customs duty on imported wheat.

The following factors have tended to lower prices. General rains in Russia and Balkan States. Argentine wheat arrives in U.S. for probable trans-shipment to Mexico. Seeding in Argentina progresses and large acreage expected. U.S. Government winter wheat estimate well-maintained.

CARE OF CREAM

Cream Cans—On receiving empty cans from the creamery, remove the lid to reduce stale odor, and before putting fresh cream into the can, wash thoroughly with clean water. While cream is stored in it can should be covered, but not air-tight, allowing possible gases to escape and prevent development of sourness in the cream.

Utensils—Separators, pails, strainers, cloths, etc., must be washed after each operation. Take separator apart and wash all parts with real hot water using a little soda or lime (not soap). Wash with a brush in preference to a cloth. Rinse thoroughly with boiling water to flush out all sediments and put parts in a clean dry place. Lime is particularly good as a harmless germicide to be used in washing of all milk utensils, but must be rinsed off after washing. In washing pails pay particular attention to seams.

Milking—Special cream can only be produced from healthy cows milked in a clean, airy barn. Cleanse cows under with a clean damp cloth. It is important to make a practice of dry milking. Milking with wet hands will contaminate the milk. Use of early covered milk pails is considered most sanitary. Separate immediately after milking to insure efficient working of separator. It is advisable to cover milk pail with a clean cloth until time of separating.

Straining—Milk should be strained through a proper metal milk strainer or through a clean double cheese cloth. If same cloth is continuing in use, it must be washed out after each milking in warm lye water, rinsed, and hung up to dry.

Strain milk into supply tank of separator, turn handle the number of revolutions prescribed by the manufacturer. For efficient work the separator should be fed a constant flow. Therefore keep in mind that when the tank is full the stream going through the fan will be greater than when only half full, and it may be found advisable to adjust the inflow while separating. Do not overlook that when the milk is fed too fast.

a proportionately greater amount of cream will come through the cream apart with a test correspondingly lower, and when the milk is going through too slow the reverse is the case, a smaller cream flow and a proportionately higher test. Incidentally, when the separator is being turned slower than the prescribed rate of speed the result will be a lower test and with a higher speed a correspondingly higher test. When the supply tank is empty use a little skim milk or clean water to force the remaining portions of cream out of the bowl. Turn cream apart to skim milk pail in time to avoid water running into cream, which occurrence would possibly lower your test.

Cooling—Immediately after separating, place cream crock in real cold water, stirring gently several times during the next half hour to quickly release animal heat. If this is not done cream will sour readily. When properly cooled (around next milking time) stir and pour into shipping can keeping same in a cool airy place and covered with a clean cloth. For holding cream the use of an ice well is preferable, but a water well may be found to be reasonably satisfactory. A sheltered tank of cold water is also satisfactory, provided the water is changed frequently. When kept in an ice house, it will be well to bear in mind that a can setting on or in ice is not nearly as well protected as when setting in cold water, owing to the fact that the density of air is much less than that of water and has much less immediate effect as a cooling agent.

Shipping—When can is full and ready for shipping, stir, and the cream line will possibly drop an inch in releasing air. Pour in more cold cream to fill. This should assure a full can of fifty or eighty pounds. Put on lid and wire down. Cream is then ready for shipping, and providing there are no flavors, etc., or delay in delivery, cream should grade special at the plant. While being transported by car or truck, can should be covered with wet blanket.

General—Never add warm cream to cold. Stir cream frequently. Taste cream before shipping and do not ship cream with off flavors such as stinkweed, garlic, onion, oil, gasoline or metallic. Such cream is a complete loss to both producer and creamery, and cannot be used in making good butter.
